

INTUITIVE RULE DESIGN

BCT CHECKIT

Improved data quality in the product development process

With early detection - prior to release - of data and consistency errors, improved data quality can be achieved in the product development process and unnecessary revisions can be avoided.

Validation of design data in Teamcenter prior to release or as part of a release process provides automatic and flexible verification of product data.

Intuitive rule design using the modern user interface

So far, the BCT CheckIt configuration was done based on XML datasets in Teamcenter.

Now, a new intuitive and modern user interface is available for administrators, to ease the configuration of BCT CheckIt validations and reduce administration work.

It can be accessed via web browser or Active Workspace. XML-based validations can still be used.
